Bayes' theorem is stated mathematically as the following equation: $P(A|B) = \frac{P(B|A)P(A)}{P(B)}$, where A and B are events and $P(A)$ and $P(B)$ are the probabilities of observing A and B independently of each other; this is known as ...

In machine learning, naive Bayes classifiers are a family of simple "probabilistic classifiers" based on applying Bayes' theorem with strong (naive) independence assumptions between the features.. Naive Bayes has been studied extensively since the 1950s. It was introduced under a different name into the text retrieval community in the early 1960s, and remains a popular (baseline) method ...

This week's post contains solutions to My Favorite Bayes's Theorem Problems, and one new problem. If you missed last week's post, go back and read the problems before you read the solutions! If you don't understand the title of this post, brush up on your memes. 1) The first one is a warm-up problem. I got it from Wikipedia (but it's no longer there):

Probably Overthinking It: All your Bayes are belong to us!

This is one of several introductory level books written by Dr. Downey recently. All of them are excellent. In this book, he gives a clear introduction to Bayesian analysis using well through out examples and Python code.

The term parameter estimation refers to the process of using sample data (in reliability engineering, usually times-to-failure or success data) to estimate the parameters of the selected distribution. Several parameter estimation methods are available. This section presents an overview of the available methods used in life data analysis.
