Dark matter is a hypothetical form of matter that is thought to account for approximately 85% of the matter in the universe, and about a quarter of its total energy density. The majority of dark matter is thought to be non-baryonic in nature, possibly being composed of some as-yet undiscovered subatomic particles. Its presence is implied in a variety of astrophysical observations, including ...

In cosmology and physics, cold dark matter (CDM) is a hypothetical type of dark matter. Observations indicate that approximately 85% of the matter in the universe is dark matter, with only a small fraction being the ordinary baryonic matter that composes stars, planets, and living organisms. Cold refers to the fact that the dark matter moves slowly compared to the speed of light, while dark ...

The diversity of hypothesized dark matter candidates is truly mind-boggling. Serious contenders include particles with radii as large as galaxies, as well as ultra tiny particles with radii one quadrillion (15 zeros) times smaller than the proton.. It doesn't even have to consist of particles at all, dark matter could be small punctures in the fabric of space and time called primordial black ...

Astronomers have long noticed an invisible elephant in the room – so-called dark matter, which seems heavier than all the visible stars, gas and dust in the cosmos by a ratio of 6-to-1.

Dark matter is present throughout the universe, forming galaxies and the largest known structures in the cosmos. It makes up around 23 percent of our universe, whereas the particles visible to us ...

Fornal and Grinstein determined that, in the simplest scenario, the hypothetical dark matter particle's mass must fall between 937.9 and 938.8 mega-electron volts, and that a neutron decaying into such a particle would emit a gamma ray of a specific energy.

The fields of Dark Matter and Neutrino Physics have experienced a tremendous growth in interest recently and face many theoretical and experimental challenges.
