Verilog, standardized as IEEE 1364, is a hardware description language (HDL) used to model electronic systems. It is most commonly used in the design and verification of digital circuits at the register-transfer level of abstraction. It is also used in the verification of analog circuits and mixed-signal circuits, as well as in the design of genetic circuits.

In computer engineering, a hardware description language (HDL) is a specialized computer language used to describe the structure and behavior of electronic circuits, and most commonly, digital logic circuits.. A hardware description language enables a precise, formal description of an electronic circuit that allows for the automated analysis and simulation of an electronic circuit.

Theoretically it is possible to get the propagation delays in and FPGA without coding, but it is not going to be easy. the easiest way to do so is to create a very simple project with the IO signals you need, write the code in VHDL, Verilog or even using schematic capture, synthesize and route the design and then look into the report file generated by the tool to see the actual delays.
