For a pump station with identical pumps, the required volume is smallest if the pumps start in sequence as the water level rises due to increasing inflow, and stop in sequence as the water level drops due to

decreasing inflow. To minimize the required sump volume, the last pump to start should be the last pump to stop, i.e. cyclic alternation.

The wet well may seem like a simple tub for holding stormwater or sewage, but poor design can cause problems for operators and damage to pumps. Considerations that influence wastewater wet well size and design include minimizing odors, eliminating air entrainment, and avoiding solids deposition and scum entrapment.
