What is Multidetector CT/CTA? Multidetector computed tomography (MDCT) is a form of computed tomography (CT) technology for diagnostic imaging. In MDCT, a two-dimensional array of detector elements replaces the linear array of detector elements used in typical conventional and helical CT scanners.

Multidetector computed tomography is also known by a confusing array of other terms such as multidetector CT, multidetector-row computed tomography, multidetector-row CT, multisection CT, multislice computed tomography, and multislice CT.

### **Definition of Multidetector computed tomography**

embolism and negative findings on multidetector-row CT should be uncommon, and the three-month risk of thromboembolism in patients with a negative multidetector-row CT scan should be low.

### **Dose Exposure of Patients Undergoing Comprehensive Stroke**

The introduction of multidetector computed tomography (MDCT) is considered a dramatic development in CT imaging that has direct implication in the imaging of various systems, in particular the cardiovascular system.

Multidetector row computed tomography (MD-CT) is a new type of CT that uses multiple detector rows, which results in finer image resolution, faster examinations, and novel imaging techniques for the display of volumetric data.

Today, the latest multidetector-row CT (MDCT) scanners offer the possibility to perform volumetric submillimetric isotropic imaging of large body areas in only a few seconds. These data can be reviewed and even directly reconstructed in any arbitrary plane.
