of the supplementary cementitious materials. Internal curing by means of superabsorbent polymers is successful, independent of this long-term higher rate of shrinkage in mixtures with supplementary cementitious materials. Superabsorbent polymers proved to be successful in mitigating self-desiccation. 1. Introduction

Classification of Polymer-Concrete Materials Significant progress has been made recently in both fundamental and applied research on all kinds of polymer/concrete system. There exist three principal classes of polymer concrete materials viz., (a) Polymer-Portland Cement Concrete (PPCC), (b) Polymer impregnated Concrete (PIC) and (c) Polymer

USE OF POLYMER CONCRETE IN CONSTRUCTION

In dry form they are prepackaged materials blended for specific applications. Whether in liquid or dry form,

each polymer has strengths and weaknesses and recommended uses. There are many reasons to add polymers to concrete overlay mixes. Polymers improve adhesion to the old surface, flexural strength, tensile strength, and freeze/thaw durability.

Understanding Polymers in Concrete| Concrete Construction

This book seeks to explore the use of polymers as additives to cementitious materials. Since their initial introduction into construction materials, the benefits of utilising polymeric materials to alter and improve the working characteristics of cement has been extensively studied.
